CHAPTER 5

SOLUTION IMPLEMENTATION

5.1 Implementation Strategy

In order to develop the system, the author used a lot software tools and hardware

with certain specification. The software tools that the author used are:

- Microsoft Windows XP Professional Service Pack 2 as the operating system.
- Microsoft Office Word XP 2002
- Microsoft Office Excel XP 2002
- Microsoft Office Vision 2003
- Microsoft Office Front Page XP 2002
- Macromedia Dreamweaver MX 2004
- Microsoft Notepad
- VertrigoServ 1.20
 - o Apache
 - o MySQL 3.23.47[2]
 - PHPMyAdmin 2.6.3-pl1[3]

Also, the hardware that is used in developing the system:

- Notebook with the necessary specification of:
 - Intel Centrino Core 2 Duo 1.66 MHz
 - RAM DDR2 512 MB

- Personal Desktop Computer with the necessary specification of:
 - Intel Pentium 4 LGA 2.66 MHz
 - RAM DDR1 1024 MB

In order to operate the system well, there is only one requirement that need to be fulfilled: any working computer that can connect to internet. The web-based tracking system provides great flexibility and easiness. The system can be accessed from anywhere with just internet connection.

5.2 Testing Implementation

The testing method that will be used to test the system is by using precondition and post condition testing method. It means, the author will input certain command to the system, and the result will be recorded, whether it return the correct result or not. This method of testing is also known as black-box testing. This mean the main point of the testing is to find out the result.
