

CHAPTER 5

DISCUSSION

PROMS (Project Management Simulator) is the name of our website. It is a project management simulation using web-based application. In building the system, author has found some difficulties.

In chapter 3, data of current system could not be found publicly. As we all know, information is a difficult thing to be found because usually information about a rare thing is confidential. This kind of situation also happens when author would like to find some information about existing system. Thus, analysis of current system is created based on author's experience in playing the simulation and based on interview of administrator's experience. In order to have system better than existing system, author needs more time to analyze the proposed system.

The most difficult problem that author found in chapter 4 is author does not familiar with the PHP programming language and Java Script. Author need to learn the basic and core of the programming language. In fact, PHP programming language is a new language for the author. However, for the past 3 months, author has attempted to catch up with the intermediate programming. Author calls the system has intermediate programming because the system divided for two users, which administrator and user. Furthermore, each user has different function, so author need to create many functions. Database also created from the basic. Author need to create only based on the analysis of the proposed data system.
